

Project Profile

King Pharmaceuticals Middleton, Wisconsin

Thrombin manufactured by GenTrac, Inc. is a sterile, freeze-dried powder formulation of thrombin obtained from cow blood plasma. Thrombin is applied to bleeding areas to form clots. GenTrac recently upgraded its production of Thrombin and called on Hooper Corporation to install new Water For Injection (WFI), Process and Clean In Place (CIP) piping systems. Hooper installed orbital welded 316L stainless steel piping for these systems. The piping was installed in phases to allow the owner to begin validating the WFI water from the new 10,000 gallon storage tank. All welds, over 1500 total, were boroscope inspected by Hooper's Quality Control personnel and verified by a qualified third party inspector, without a single rejection. Hooper also installed all of the steam piping for the expansion project.
